

STAMPING DEVICE

Abstract of the Disclosure

A stamping device stamps characteristic data, especially in the form of code numbers (22), into plastic products. Such containers are preferably produced according to blowing, filling and gelling methods. At least one stamp (32), having a stamping unit (34) with interchangeable characteristic data units (42), is guided in the longitudinal direction in the frame (24) of the device. When the stamp is in an elevated position, the products to be stamped and/or have been stamped can be fed or removed. When in a lowered position, the products are stamped.
